

To Care For Your Poinsettia

- Place your plant in indirect sunlight for at least 6 hours per day.
- Provide room temperatures between 68 and 70 degrees F.
- Water your plant thoroughly when the soil is dry beneath the surface.
- Fertilize your plant after the blooming season with a balanced, all-purpose fertilizer.
- Avoid cold drafts or excessive heat.
- Do not expose your plant to temperatures below 50 degrees F.
- Do not over water poinsettias.

After the Holidays

With proper care, your poinsettia can last long past the holiday season. Here's how: By early April, when the colored bracts begin to turn or fall, cut the plant back leaving 4 to 6 buds. Keep the plant near a sunny window, water and fertilize regularly, and by the end of May you should see vigorous new growth. Continue to nurture your plant as Autumn nears.

The poinsettia begins to set buds and produce flowers as the nights become longer. Beginning October 1, keep a plant in complete darkness for 14 continuous hours each night by moving it into a dark room or placing a large box over it. During the day, allow 6-8 hours of bright sunlight. Continue this for 8-10 weeks, and a poinsettia will develop a colorful display of holiday blooms!

Your Poinsettia will be delivered on November 30, 2011.

Thank you for supporting MOR.
